# Population and Reproductive Health in National Adaptation Programmes of Action (NAPAs) for Climate Change

*Clive Mutunga*

*Karen Hardee*

## Introduction

Perhaps the greatest irony of climate change is that countries that have had the least to do with growing emissions are likely to experience the most severe impacts. Due to the persistence of carbon in the atmosphere, global warming is inevitable in the coming decades under any scenario produced by the Intergovernmental Panel on Climate Change (IPCC), and global greenhouse gas emissions will continue to increase at least up to the year 2020 (IPCC, 2007). While mitigation is critical, there is a growing consensus that helping affected countries and people adapt to climate change is also important since the impacts of climate change are already being felt and will worsen in the future (IPCC, 2001; Huq et al., 2003; AIACC, 2004; UNFCCC, 2007a; UNDP, 2008; FAO, 2008; UNFCCC, 2009).

While most of the international focus is on mitigation of climate change, including through well-publicized international conferences and agreements such as the Kyoto Protocol, adaptation as a response to the climate change problem has gained importance in the international policy agenda (Reid and Huq, 2007). For example, the Bali Action Plan, an addendum to the United Nations Framework Convention on Climate Change (UNFCCC), recently identified the need for enhanced action on adaptation (UNFCCC, 2007a).

A large share of the population in developing countries is already vulnerable and living in marginalized areas that are susceptible to climate variation and extreme weather events. Population growth is occurring most rapidly in the developing world, increasing the scale of vulnerability to the projected impacts of climate change. In 2005, the average population density in developing countries was 66 people/km<sup>2</sup> compared to 27 people/km<sup>2</sup> in developed regions (Jiang and Hardee, 2009). More than half (27) of the 49 Least Developed Countries (LDCs) are projected to at least double their current population by 2050, based on the most recent population projections of the United Nations. Human population growth will increase vulnerability to many of the most serious impacts of climate change. Scarcity of food and water, vulnerability to natural disasters and infectious diseases and population displacement are all exacerbated by rapid population growth (Jiang and Hardee, 2009; GLCA, 2009).

Recognizing that LDCs, including developing Small Island States, are among the most vulnerable to, and have the least capacity to cope with, extreme weather events and the adverse effects of climate change, National Adaptation Programmes of Action (NAPAs) were established as part of the Marrakech Accords of the 2001 UNFCCC Conference of Parties (COP). NAPAs were intended to provide assistance to LDCs in developing plans to address the adverse effects. NAPAs, which are supposed to link with national development processes, provide an avenue for LDCs to identify priority activities that respond to their urgent and immediate adaptation needs.

What is the experience with NAPAs to date? What interventions are being included in NAPAs? Are population and reproductive health/family planning (RH/FP) addressed in NAPAs, including through projects proposed by countries? This chapter begins with a description of the NAPA process and a discussion of their development, preparation and financing. It then analyses how population factors are addressed in NAPAs and the range of adaptation interventions identified and prioritized by countries, including RH/FP. The chapter ends with a discussion of the challenge of addressing population and RH/FP through the existing NAPA process and a discussion of how NAPAs are aligned with national development processes. Finally, the chapter makes suggestions for the NAPA process to include more integrated programming that links with development strategies.

## Methodology

The 41 NAPAs that were submitted as of May 2009 were included in the analysis. Relevant information on all NAPAs and projects was assembled by the authors into an Excel database. Analysis focused on this database and on content of the NAPAs and projects. This information was supplemented by a review of the literature on NAPAs, adaptation and the relationship between population and climate change.

## Development, Preparation and Financing of NAPAs

Among the 49 eligible LDCs, 41 (85 per cent) have submitted their NAPAs to UNFCCC. In addition, three NAPAs are in the final stages of preparation and are expected to be completed by the second quarter of 2009. Finally, preparation has been initiated in four countries, and the NAPAs are expected to be completed before the end of 2009. The current status of preparation of the NAPAs is presented in Table 11.1.

According to UNFCCC, the rationale for developing NAPAs rests on the high vulnerability and low adaptive capacity of LDCs, many of which count among some of the world's poorest. This demands, in turn, the immediate and urgent support for projects that allow for the adaptation to the adverse effects of climate change. As such, "activities and projects proposed through NAPAs are those whose further delay could increase vulnerability or lead to increased costs at a later stage" (UNFCCC/LEG, 2002, p. 1). Acknowledging that countries need to have

**Table 11.1: Analysis of NAPAs**

	<b>Number</b>
<b>Development and Preparation of NAPAs</b>	
Total NAPAs submitted [as of May 2009]	41
NAPAs available in Draft form	1
NAPAs in preparation stage	6
Total number of priority projects identified in NAPAs	448
NAPAs not clearly demonstrating linkages to national development planning processes including Poverty Reduction Strategies (PRSs)	31
<b>NAPAs' Coverage of Population and Reproductive Health/Family Planning (RH/FP) Issues</b>	
NAPAs recognizing 'rapid population growth' and linking it to climate change	37
NAPA mentions RH/FP and links it to adaptation strategy	6
NAPA identifies RH/FP project as part of country's priority adaptation strategy	2
Total number of RH/FP projects that have been funded	0
Number of LDCs whose population is projected to at least double by 2050	27
<b>Unmet Need for Family Planning among LDCs</b>	
	<b>Per Cent</b>
Countries with over 20 per cent unmet need for family planning	80
Countries with over 10 per cent unmet need for family planning	90

national adaptation plans which identify and prioritize not only urgent and immediate needs but also medium- and long-term needs, longer-term national adaptation plans are part of the on-going UNFCCC negotiations.<sup>1</sup> It was envisaged that NAPAs would fit into the longer-term national plans of adaptation.

Following NAPA guidelines, countries undertake four steps to develop their NAPAs: 1) establish a NAPA organization that should include local communities and representatives from various sectors (e.g., agriculture, water, energy, forestry, health and tourism); 2) synthesize available information on impacts, coping strategies, national and sectoral development plans to provide a baseline measure of vulnerabilities; 3) identify projects through consultations with stakeholders and develop a list of priority projects; and 4) submit the NAPA to UNFCCC.

An important guiding principle in the preparation of NAPAs is that the process ought to be a bottom-up, participatory approach that involves a broad range of stakeholder groups and focuses on local communities, considering their current vulnerability and urgent adaptation needs (UNFCCC/LEG, 2002).

Financing is a key component of NAPAs. Although estimates of the funding required to assist developing countries to adapt to the impacts of climate change vary widely,<sup>2</sup> there is general agreement that the cost could be in the range of tens of billions of dollars per year. The total indicative estimated cost of implementing the 448 projects prioritized by the 41 NAPAs is over US\$800 million,<sup>3</sup> yet, currently, the NAPAs fund, the Least Developed Country Fund (LDCF), has

mobilized about US\$176 million, hence showing a huge disparity between the financial needs of NAPAs and the mobilized financial resources. Furthermore, there is consensus that resource shortfalls hinder funding of NAPAs and that countries are generally underestimating the costs of adaptation (Agrawala and Fankhauser, 2008; CCCD, 2009).

## How NAPAs Characterize Population as a Factor Related to Climate Change

Analysis of NAPAs to explore how they describe population dynamics and climate change showed that most NAPAs identify population and health issues as relevant for climate change adaptation strategies.

Thirty-seven NAPAs explicitly make linkages between climate change and population and identify rapid population growth as a problem that either aggravates the vulnerability or reduces the resilience of populations to deal with the effects climate change (Table 11.1). Although the different NAPAs have diverse concerns, the effects of rapid population growth have been linked with climate change through five factors: food insecurity; natural resource depletion/degradation; water resource scarcity; poor human health; and migration and urbanization.<sup>4</sup>

### *Population pressure and food insecurity*

Thirty-five NAPAs link high population growth to food insecurity. Population pressure contributes to this by increasing a country's vulnerability to food shortages in the event of occurrences such as droughts and floods and by increasing demand for food and putting additional pressure on the food supply system and already diminishing food resources, for example, fish stocks, as reported in Bangladesh, Gambia, Kiribati, Solomon Islands and Tuvalu.

Population pressure is more pronounced in certain areas that are more susceptible to events such as droughts and floods. For instance, NAPAs recognize high populations residing in low-lying coastal areas (Samoa, Solomon Islands), hilly or mountainous areas (Tuvalu) and on scarce arable land (Central Sudan along the Nile River, Uganda).

### *Population pressure and natural resource depletion/degradation*

Natural resource depletion or degradation is a central theme of the NAPAs and is often linked to population pressure. Excerpts from selected NAPAs indicate that rapid population growth: “*results* in the imbalance of the already limited resources and the threat of climate instability” (Comoros), “*is a cause* of decline in resources base” (Ethiopia), “*is partly contributing* to unsustainable natural resource use” (Gambia), is “*linked to* environmental resource stress” and “*leads to* excessive fishing and to structural changes to the shoreline” (Kiribati), has “*led to* ecological imbalances expressed by the deterioration of livelihoods” (Niger), is

“an important factor of pressure on the environment” (Haiti), is “*placing pressure on sensitive environments*”(Tuvalu) and “*tend[s] to degrade highland ecosystem*” (Uganda) [emphasis added].

Population pressure is directly linked to deforestation in the NAPAs of Mozambique, Rwanda, Sierra Leone, Solomon Islands and Uganda. The Uganda NAPA goes further in associating high population density with observed biodiversity loss.

### ***Population pressure and water resource scarcity***

Population pressure is deemed to increase the demand for water and further reduce its future availability. In Sudan, for example, “unfavorable weather conditions combined with population growth has rendered the Setaite River incapable of sustaining the town of Gedarif”. Water scarcity is identified as a common problem in Tuvalu and is associated with the growth in population and urbanization. Vanuatu’s NAPA acknowledges that population growth, particularly in urban areas, has already placed pressure on water resources and supply services and that climate change is likely to increase demand for water while impacting on both the quantity and quality of water resources. Population increases in urban centres have put pressure on groundwater, as noted by Zambia’s NAPA.

### ***Population pressure and poor human health***

A number of NAPAs link population and climate change to risks to human health. Kiribati notes that the spread of waterborne diseases is associated with high population density in urban areas. Maldives’ NAPA asserts that “the vulnerability to climate change related health risks is further compounded by local characteristics such as the high level of malnutrition in children, accessibility and quality of healthcare, high population congestion and low income levels”. In Tuvalu, the NAPA contends that “overpopulation” increases pressure on resources and risks of waterborne diseases. In Uganda, the NAPA notes, heavy rainfall has led to flash floods and resulted in the outbreak of waterborne diseases such as diarrhoea and cholera, while prolonged dry spells have resulted in outbreaks of respiratory diseases. Population pressure increases the country’s vulnerability to these diseases and its ability to cope with increased health costs.

### ***Population pressure, migration and urbanization***

Eighteen NAPAs link climate change to another major demographic concern, migration. Climate change imposes additional burdens on communities already facing migratory challenges caused in part by rapid population growth. The migrating populations, either in search of new agricultural lands and pastures or urban areas, are already economically vulnerable, and this vulnerability is increased since, in most cases, the zone that receives them is often already faced with a high risk of economic, social and environmental vulnerability.

The migration of people and cattle, noted as one of the traditional adaptation strategies in Burundi and Niger, is identified as one of the real and potential adverse impacts of climate change. The migration of at least 10 per cent of the population and a loss of cultivable lands is an anticipated impact of climate change in the Comoros, while, in the United Republic of Tanzania, people living along the coast will be forced to migrate, something which may cause social conflicts and environmental degradation due to rapid population growth.

In Burkina Faso and Rwanda, people migrating from densely populated regions looking for better living conditions in less-populated areas not only increase their vulnerability by exposing themselves to a high risk of drought and desertification in the recipient areas but also by contributing to further degradation.

Climate change will have a significant impact on urban settlements, especially in the face of increasing population and continual urban migration. Samoa's NAPA notes that poor drainage systems, lack of strategic planning and an increasing urban population will only exacerbate the impacts of climate change on urban settlements. In Djibouti, the NAPA notes, unfavourable climatic conditions have led to migration from rural areas to "new urban areas" where previously nomadic populations are being forced to settle around water points established by the State. Rapid urbanization in Gambia is "paralleled by clearing of forests and woodlands, expansion of cultivated area, over-fishing of particular species and severe coastal erosion".

The Solomon Islands' NAPA asserts that, with an increasing population, waste management problems are an issue of increasing concern. In Sao Tome and Principe, the relocation of the population at risk of food insecurity and landslides in Malanza, Santa Catarina and Sundry was identified as a priority adaptation activity.

In summary, NAPAs are quite thorough in their treatment of the effects of population and climate change, although analyses of demographic factors, including age structure and household size, are not adequately addressed. A number of researchers have identified analysis of these demographic factors as important for understanding the links between population and climate change (Jiang, 1999; Jiang and O'Neill, 2004; Liu et al., 2003; Mackellar et al., 1995; Prskawetz et al., 2004; van Diepen, 2000).

Given that population is highlighted in most NAPAs, it follows that projects to address the effects of rapid population growth are included among priority projects. The next section examines which sectors and projects were prioritized in the NAPAs.

## Sectoral Classification of Submitted NAPA Projects and Priority Projects

The total number of priority adaptation projects identified in the 41 NAPAs is 448, although the number of such projects varies widely among the countries. Using the same classification as UNFCCC (2009), identified projects fall into 12 broad categories, as shown in Figure 11.1. Some projects and activities are difficult to classify into any one sector, therefore UNFCCC includes them in a cross-sectoral

category. In the NAPA preparation process, projects are ranked by the stakeholders in order of importance, subject to select criteria, including the expected outcomes of the projects, for example, mitigating adverse effects of climate change, poverty reduction to enhance adaptive capacity, synergy with multilateral environmental agreements and cost effectiveness (UNFCCC/LEG, 2002).

Figure 11.1 shows the distribution of projects by sector. Half of the projects fall into three sectors: food security, terrestrial ecosystems and water resources. This can be explained by the fact that agriculture, livestock, fisheries and other income-generating activities rely on terrestrial ecosystems and water resources which are important for feeding and sustaining livelihoods for millions of people. The health sector accounts for around 7 per cent of the total projects, after food security (21 per cent), water resources and management (16 per cent), terrestrial ecosystems (15 per cent), cross sectoral (9 per cent) and coastal zones and marine ecosystems (8 per cent). In addition, in the Solomon Islands and Sudan, two cross-sectoral projects have health sector components. The fewest identified priority projects are in the tourism, insurance and energy sectors.

All 41 countries identify the health sector as among the most vulnerable to climate change. However, less than half of the countries (18) have proposed a single project in this sector. In terms of priority project ranking, projects in the health sector are generally not ranked among the first five priorities in any of the NAPAs (Figure 11.2). Indeed, the ranking of the priority projects follows the same pattern as the distribution of the projects by sector. Health sector projects would therefore be ranked 6<sup>th</sup> in terms of priority.

In an analysis of 14 NAPAs by Osman-Elasha and Downing (2007), a major weakness identified during the preparation of NAPAs was the institutional barriers that hindered a free exchange of information, including communication problems between central offices and regions or provinces. The authors found that NAPA coordination teams are mainly found either under the umbrella of environment or the meteorology departments and also mostly host/house UNFCCC Focal Points. This composition of the teams has implications for the content of the NAPAs and may explain the low priority given to health—and by extension, RH/FP.

## Reproductive Health/Family Planning and Adaptation Strategies in NAPAs

Since most of the NAPAs identify rapid population growth as an integral challenge to adapting to climate change, it follows that slowing population growth should be a key component in dealing with the effects of climate change. Reduced population pressure can ameliorate some of the effects of climate change and/or increase the ability of countries to adapt. RH/FP has been recognized as one of many strategies that can slow population growth and reduce demographic pressure (Ross, 2004; Moreland and Talbird, 2006). Yet, as mentioned above, there is limited identification of adaptation projects in the health sector, under which RH/FP broadly falls. In addition, the

**Figure 11.1: Distribution of NAPA Projects by Sector**

identified health-sector projects are not ranked highly among the priority actions, and priority actions are more likely to be implemented.

Only six NAPAs, described below, clearly state that slowing of population growth or investments in RH/FP should be considered among the country’s priority adaptation actions (Table 11.1). These countries include the Comoros, Ethiopia, Gambia, Kiribati, Uganda and Zambia. Furthermore, among those NAPAs that clearly make this case, only Uganda actually proposes a project with components of RH/FP among its priority adaptation interventions. Another project with RH/FP components is proposed by Sao Tome and Principe, but its NAPA

**Figure 11.2: Priority Ranking of NAPA Projects by Sector**

neither links population pressure to climate change nor to RH/FP. In both Sao Tome and Principe's and Uganda's NAPAs, RH/FP is integrated with other priority adaptation interventions.

**Comoros'** NAPA notes that population growth is a source of vulnerability and credits family planning programmes for the reduction in the population growth rate. Even though the NAPA establishes clearly the linkage between climate change and FP policies, the NAPA team fails to identify a priority project with RH/FP programmes.

In **Ethiopia**, high population growth is identified as one of the causes of vulnerability to climate change. During the NAPA process, mainstreaming family planning into agriculture was proposed in the regional consultative workshops as an adaptation strategy. Although the NAPA identifies mainstreaming of family planning into agriculture as one of the potential cross-sectoral adaptation options, there is no component of RH/FP in any of the proposed priority agricultural projects.

In **Gambia**, partly as a result of population pressure, the natural environment has taken the full brunt of unsustainable use of natural resources, as seen in the negative effects on the forest cover, rangelands and aquatic and marine organisms, as the NAPA reports. Taking cognizance of this fact, the NAPA proposes the stabilization of rural populations as a strategy for adaptation. However, none of the identified priority adaptation actions have RH/FP components or other interventions designed to stabilize rural populations.

**Kiribati's** NAPA mentions that the country has population policies to encourage family planning, although these policies are yet to have a substantive effect. In the final ranking of projects, the NAPA team clearly identified family planning as an adaptation strategy. Surprisingly, the identified priority projects did not have a single RH/FP project among them, despite the explicit mention. However, the document distinguishes between short-term adaptation, focusing on urgent and immediate needs (through the NAPA), and long-term strategic planning for adaptation which is addressed by an existing project outside the NAPA, the Kiribati Adaptation Project, which has "support for population and resettlement" as one of its programmes.

**Sao Tome and Principe's** NAPA mentions the vulnerability of its essentially young (79 per cent under 35) and predominantly urban population, manifested through frequent migration by coastal populations due to an increase in floods and coastal erosion. However, the NAPA neither acknowledges population pressure nor links it to climate change or to RH/FP. Yet it is one of the few countries to identify a project with components of RH/FP. The project, ranked 3<sup>rd</sup> and titled "Communication Action for Behavior Change", has the objective of informing and sensitizing the population to behaviour changes for the prevention of diseases related to water, vector transmission and other health problems linked to climate change. It specifically includes a component on family planning counselling.

The **Uganda** NAPA makes a clear link between population and climate change and notes the need for family planning. The document identifies a negative social coping strategy, "famine marriage", where, in times of food crisis, some parents distressfully marry off their daughters to secure dowry for survival. This practice fuels early marriage, dropping out of school and exposure to sexually transmitted

infections and related reproductive health complications. The NAPA team identifies the “Community Water and Sanitation Project”, which includes slowing population growth through family planning, as part of a scaled-up poverty alleviation programme. However, the project profile does not mention the specific interventions in RH/FP, perhaps anticipating that NAPA project activities would link with RH/FP services in the country.

**Zambia’s** NAPA reiterates the importance of meeting the goals of the Fifth National Development Plan (FNDP) 2006-2010, which includes integrated reproductive health with the objective of reducing the maternal mortality ratio. Despite this clear appreciation of the role of RH/FP in the NAPA and the linkage to the national development plan, the project team does not propose a project specific to RH/FP.

In summary, as shown in Table 11.1, although population is mentioned as an important factor related to climate change in 37 NAPAs, only six explicitly state that slowing population growth or meeting an unmet demand for RH/FP should be a key priority for their adaptation strategies, and only two NAPAs propose projects that include RH/FP. Neither of these projects has been funded.

## Alignment of NAPAs with the National Development Planning Process

Since many of the adaptation needs identified in NAPAs are directly related to development issues, the effectiveness of NAPAs could be enhanced by integrating them into current development plans, policies and programmes, including Poverty Reduction Strategies (PRSs). Ensuring that adaptation strategies align with national development processes could link development and climate change agendas. This is important since national development plans and strategies provide a framework for domestic policies and programmes, as well as for foreign assistance, with the overall aim of reducing poverty (Bojo et al., 2004). Theoretically, NAPAs and PRSs should embrace common projects that are built upon both short-term adaptation interventions and longer-term development strategies (McGray et al., 2007).

A brief analysis of NAPAs reveals that even though all the documents have a section on the linkage of the NAPA with national development plans, the two are, in many cases, not well aligned. Two categories have been identified under which the NAPAs fall in relation to alignment with national development planning processes. The first group, consisting of about 31 countries (76 per cent), has NAPA documents which do not clearly demonstrate how they are linked to the national development processes. These documents only mention that the NAPA “was created on the basis of . . .”, “has established strong linkages with . . .”, or “supports . . .” the national development goals and strategies as espoused in the country’s development plans without articulating any clear linkages.

The second category consists of 10 countries (24 per cent) whose documents clearly establish the linkages between the NAPA and national development plans, complete with detailed analyses of the identified vulnerabilities and proposed projects. Some of these contain matrices of analyses showing how the NAPA fits

into specific national development and sectoral development goals and even into specific programmes and projects (Table 11.1).

Consensus is emerging about the disconnect between NAPAs and PRSs. A recent study commissioned by the Global Environment Facility (GEF) shows that mainstreaming adaptation into development agendas has not yet penetrated the world of PRSs (Hedger et al., 2008). According to the report, UNFCCC workshops have noted that crucially little work has been undertaken to integrate adaptation into development plans or existing poverty alleviation agendas.

A review of 19 PRSs in the 2007/2008 *Human Development Report* (UNDP, 2007) found that, although most of them cited climate events and weather variability as important drivers of poverty and constraints on human development, only four countries identified specific links between climate change and vulnerability. A similar observation was made by UNDP's Water Governance Facility (WGF) (2009), which notes that a major weakness of NAPAs is the lack of clear linkages between their content and that of PRSs and other national development strategies.

This disconnect may be due, in part, to the structural differences between development plans and NAPAs, both of which ought to be undertaken in a participatory process, with a multidisciplinary approach and a sustainable development perspective. Although the sustainable development approach implies a longer-term perspective, the guidelines for NAPAs to be "action-oriented" and "set clear priorities for urgent and immediate adaptation activities" (UNFCCC/LEG, 2002, p. 2) imply a shorter-term perspective. It is important, however, that NAPAs not only take into account short-term projects but also recognize the need for a coherent long-term adaptation strategy to which the implementation of the identified projects will contribute (WGF, 2007).

NAPAs are, by definition, project-oriented. UNDP finds that most NAPAs focus entirely on small-scale project-based interventions to be financed or co-financed by donors; this has resulted in "an upshot of a project-based response that fails to integrate adaptation planning into the development of wider policies for overcoming vulnerability and marginalization" (UNDP, 2007, p. 188). WGF (2009) corroborates this view by asserting that NAPAs generally focus on projects and are often not successful at integrating long-term development objectives. McGray et al. (2007) state that the disconnect between NAPAs and the PRSs arises from the fact that the latter are prepared by ministries of finance or planning, which are often entirely disconnected from the environment ministries most closely associated with the NAPA process. Osman-Elasha and Downing (2007) suggest viewing NAPAs as primarily important for raising awareness, at least among national stakeholders, and placing climate change adaptation on the development agenda.

## The Need for an Integrated Approach to Adaptation Strategies

Although a majority of the NAPAs identify rapid population growth as an integral key component of vulnerability to climate-change impacts, few choose to priori-

tize NAPA funds for RH/FP programmes. Faced with multiple competing development priorities and climate-change challenges, countries prioritize projects that are geared towards the alleviation of food insecurity and water resource scarcity, which are two key problems facing LDCs. Yet, in the LDCs, unmet need for family planning, or the percentage of women who want to stop having children or who wish to wait at least two years before having another child, is high. Yemen has the highest rate (50.9 per cent), and 80 per cent of the countries have over 20 per cent unmet need (Table 11.1). Mainstreaming RH/FP into projects designed to address food insecurity and water scarcity can help slow population growth and alleviate pressure on limited food and water resources.

There is also a likelihood that a majority of stakeholders involved in the preparation of NAPAs, although recognizing the importance of stabilizing population growth to better adapt to future climate changes, do not perceive RH/FP programmes to be urgent and immediate projects but rather long-term strategic planning interventions, perhaps best addressed in national development plans and PRSs. It is important to note, however, that population and RH/FP issues have not been adequately addressed by PRSs either. According to a World Bank review (2007), most of the PRSs recognized population growth as an important issue for poverty reduction and included objectives and strategies but failed to translate these into specific policies or indicators to measure progress over time. An unpublished review of 45 PRSs found that while two thirds of them mention family planning, less than half include any implementation details (Borda, 2005).

This view is given credence by the Kiribati NAPA, which clearly distinguishes between short-term adaptation for urgent and immediate needs (through the NAPA) and long-term strategic planning for adaptation (addressed by an existing project outside the NAPA, the Kiribati Adaptation Project, which has support for population and resettlement as one of its programmes). Even though the NAPA guidelines state the importance of aligning projects to long-term sustainable development planning, they place greater focus on urgent action, which may be construed by NAPA stakeholders to imply short-term rather than long-term planning and development.

Components of health and RH/FP, however, could be integrated into projects in other sectors, as has been done in the NAPAs from Sao Tome and Principe and Uganda. For example, integrating health into projects that focus on agriculture and water resources, which have a higher likelihood of being given a high priority for NAPA funding, would improve the chances of RH/FP being implemented. Furthermore, such integrated projects are more likely to meet the needs of vulnerable populations, which face risks in all aspects of their lives—food, shelter, livelihoods, health, etc., including their voiced desire to stop or space childbearing.

## Conclusions and Recommendations

NAPAs are a major mechanism through which adaptation funding is to be provided to LDCs, which are likely to face the most severe impacts of climate change. This

chapter has shown that the NAPA process favours short-term project responses to climate change adaptation and that priority tends to be given to single-sector projects focusing on food security and water resources. The NAPA process has also not been successful in aligning urgent and immediate actions to address vulnerability to climate change with existing national development planning processes, including PRSs, despite the requirement to do so. Thus, LDCs—and the global community—are missing an important opportunity to link meeting immediate and short-term adaptation needs with longer-term development issues, including the Millennium Development Goals (MDGs), that will also strengthen people's ability to adapt to climate change.

Furthermore, demand for funding exceeds current available resources for NAPAs, indicating that developed countries are not meeting their promises to fund adaptation to climate change in the most affected countries.

Since environmental degradation and climate change have been linked to demographic factors, including population growth, slowing the rate of growth should be among the strategies implemented through NAPAs—and through national development plans. Voluntary RH/FP that respects the rights of individuals to choose the number and spacing of their children is recognized as one of many strategies that can help improve livelihoods and protect the environment by slowing population growth and reducing population pressure. RH/FP, included with investment in girls' education, economic opportunities and the empowerment of women and investments in youth, which are all part of the MDGs, can help developing countries speed up their demographic transition from high to low fertility, lower mortality rates and will likely help people adapt to climate change.

This analysis of NAPAs shows that population pressure is recognized as an issue related to the ability of countries to cope with climate change. Thirty-seven of the 41 NAPAs submitted broadly recognize and link rapid population growth to challenges the countries face in adapting to climate change. However, these linkages are not matched by a proportional response through adaptation projects that address population, including access to voluntary RH/FP. Only two countries among the 41 include RH/FP projects in their NAPAs, and neither of those projects has received funding.

This review leads to five recommendations:

- The favouring of single-sector projects within the NAPAs over integrated programmes does not reflect people's lives. Strategies for adaptation should reflect a multisectoral approach that recognizes that people do not live in single sectors. People deal simultaneously with food, water, livelihoods, health and education, among other issues, including reproductive health. Wherever appropriate, projects or programmes funded through NAPAs should be integrated across sectors to avoid 'winner' and 'loser' sectors.
- The focus of NAPAs on short-term projects, rather than on linkages with development strategies that address medium- and longer-term issues, is

inadequate. As countries develop longer-term adaptation strategies, a mix of short- and longer-term projects that involve participation across development sectors is important to ensuring a wide range of adequate responses in adapting to climate change that can save lives and, ultimately, strengthen livelihoods.

- NAPAs should translate the recognition of population pressure as a factor related to the ability of countries to adapt to climate change into relevant project activities. Such projects should include access to RH/FP, in addition to other strategies that reduce unwanted fertility, such as girls' education, women's empowerment and a focus on youth.
- Countries that have already clearly identified RH/FP projects in their NAPAs should expedite their implementation.
- Attention to population and integrated strategies should be central and aligned to longer-term national adaptation plans and strategies currently being discussed as part of enhanced action for adaptation.

## Notes

- 1 Longer-term national adaptation plans are part of the UNFCCC discussions on enhanced action on adaptation taking place under the "Ad Hoc Working Group on Long-Term Cooperative Action" (AWG-LCA) and were featured at its 6<sup>th</sup> Session held in Bonn, 1-12 June 2009.
- 2 The estimated annual costs of adaptation (US\$) range from 31 billion (Stern, 2006), 34 billion (The World Bank, 2006), 55-135 billion by 2030 (UNFCCC, 2007b), 50 billion (Oxfam International, 2007) to 89 billion by 2015 (UNDP, 2007).
- 3 The total cost of implementation of all the NAPAs is currently estimated at US\$2 billion by Oxfam and the International Institute for Economic Development (IIED), revised up from the original US\$1.6 billion. This was based on an extrapolation of the costs of submitted NAPAs.
- 4 This classification was guided by an unpublished analysis on population and NAPAs by MSI and PSN (2009) characterizing population as affecting climate change primarily in three ways: "(1) by acting in tandem with climate change to deplete key natural resources, for example through soil erosion and deforestation, (2) by causing a significant escalation in demand for resources, such as fresh water and food, that are declining in availability due to climate change, and (3) a heightening of human vulnerability to the effects of climate change, including by increased pressure on human health and by forcing more people to migrate and settle in areas at risk of extreme weather events" (p. 7).
